

Chlorophytic Alga		Ulva spp.
<b>I. Current Status and Distribution</b>		<b><i>Ulva (Enteromorpha) spp.</i></b>
<b>a. Range</b>	<b>Global/Continental</b>	<b>Wisconsin</b>
<b>Native Range</b> Cosmopolitan marine species <sup>1,2</sup>	 <p style="text-align: center;"><i>Figure 1: Global Distribution Map</i><sup>3</sup></p>	Not recorded in Wisconsin
<b>Abundance/Range</b> Widespread: Locally Abundant: Sparse:	Worldwide coasts and estuaries Muskegon Lake, Michigan <sup>1</sup> ; river upstream of hydropower station in Poland <sup>4</sup> Undocumented	Not applicable Not applicable Not applicable
<b>Range Expansion</b> Date Introduced: Rate of Spread:	2003; three lakes in the Great Lakes region <sup>1</sup> Undocumented	Not applicable Not applicable
<b>Density</b> Risk of Monoculture: Facilitated By:	Blooms and green tides widely reported <sup>5</sup> ; forms dense mats with masses on shore Addition of nitrogen (urea, nitrate, ammonium) and phosphorus; increased salinity due to industrial activity <sup>1,6,7</sup>	Unknown Unknown
<b>b. Habitat</b>	Lakes, rivers, estuaries, marine coastal waters <sup>1,8</sup>	
<b>Tolerance</b>	Chart of tolerances: Increasingly dark color indicates increasingly optimal range	
Salinity <sup>2,8</sup> (psu)	 <p style="text-align: center;">** algae dies at psu ≤ 1</p>	
<b>Preferences</b>	In the Great Lakes Region, <i>E. flexuosa</i> subsp. <i>flexuosa</i> and subsp. <i>paradoxa</i> are found in sites that have a high level of industrial activity and hazardous waste sites <sup>1</sup> ; eutrophic systems <sup>8</sup> ; nutrient enrichment <sup>6</sup> ; high salinity <sup>1</sup>	
<b>c. Regulation</b>		
Noxious/Regulated:	<i>Not regulated</i>	
Minnesota Regulations:	<i>Not regulated</i>	
Michigan Regulations:	<i>Not regulated</i>	
Washington Regulations:	<i>Not regulated</i>	

<b>II. Establishment Potential and Life History Traits</b>	
<b>a. Life History</b>	Foliose tubular chlorophyte <sup>7,9</sup>
<b>Fecundity</b>	Undocumented
<b>Reproduction</b>	Sexual; Asexual <sup>10</sup>
Importance of Spores:	Zoospores less tolerant of low salinity, PO <sub>4</sub> -P limitation and NH <sub>4</sub> -N toxicity <sup>8</sup> ; bloom/tide-forming version does not produce spores <sup>5</sup>
Vegetative:	Populations can persist through fragmentation alone <sup>5</sup> ; lack of reliance on spores translates to broader salinity tolerance <sup>5</sup>
<b>Hybridization</b>	Undocumented
<b>Overwintering</b>	
Winter Tolerance:	High; survives in Lake Michigan, Manitoba; small fragments persist through winter in Finland <sup>5,11</sup>
Phenology:	Prolific production just after ice out in Finland <sup>5</sup>
<b>b. Establishment</b>	
<b>Climate</b>	
Weather:	Tolerant of very cold temperatures in Finland; also thrives in warm-water discharge area near a nuclear power plant on the Bothnian Sea <sup>11</sup>
Wisconsin-Adapted:	Yes
Climate Change:	Undocumented
<b>Taxonomic Similarity</b>	
Wisconsin Natives:	Unknown
Other US Exotics:	Cosmopolitan genus: present in oceans and estuaries of the world; also some freshwater habitats <sup>9</sup>
<b>Competition</b>	
Natural Predators:	Various benthic and other grazers
Natural Pathogens:	Undocumented
Competitive Strategy:	Eutrophication facilitates blooms which decreases space and nutrients available to other species; species is pulse tolerant <sup>5</sup> ; can take up HCO <sub>3</sub> under conditions of high pH and low inorganic carbon <sup>12</sup>
Known Interactions:	Outcompetes phytoplankton under conditions of moderate to high nutrient concentration <sup>1</sup>
<b>Reproduction</b>	
Rate of Spread:	Undocumented
Adaptive Strategies:	Undocumented
<b>Timeframe</b>	Undocumented
<b>c. Dispersal</b>	
Intentional:	Unlikely
Unintentional:	On ships, in ballast; potentially on boats, waders, rigging; aquarium disposal
Propagule Pressure:	Undocumented

### III. Damage Potential

#### a. Ecosystem Impacts

<b>Composition</b>	Low epiphytic diatom densities on <i>Enteromorpha</i> <sup>1</sup> ; blooms may be responsible for historic loss of eelgrass in southern California <sup>5</sup> ; diversity decreases in eutrophic (bloom) conditions <sup>14</sup> ; detrimental effects on macrofauna <sup>15</sup>
<b>Structure</b>	Declines in biomass of seagrass and macrobenthic organisms <sup>16</sup> ; reduces sediment erosion, enhances sediment deposition <sup>17</sup>
<b>Function</b>	Green tides shade macrophytes and disrupt feeding by wading birds <sup>5</sup> ; produces ethene (acts as macrophytic hormone) <sup>18</sup> ; uncertain effects on littoral zone food webs <sup>1</sup>
<b>Allelopathic Effects</b>	Undocumented
<b>Keystone Species</b>	Undocumented
<b>Ecosystem Engineer</b>	Decrease in inorganic carbon is severe in high pH conditions
<b>Sustainability</b>	Undocumented
<b>Biodiversity</b>	Bloom conditions cause decrease in biodiversity <sup>14</sup>
<b>Biotic Effects</b>	Detrimental effects on macrofauna, diatoms, macrophytes <sup>1,15,16</sup>
<b>Abiotic Effects</b>	Creates conditions of high pH and low inorganic carbon <sup>15</sup>
<b>Benefits</b>	May increase rates of sedimentary nitrogen cycling <sup>5</sup> ; affects sediment dynamics <sup>17</sup>

#### b. Socio-Economic Effects

<b>Benefits</b>	Undocumented
<b>Caveats</b>	Not applicable
<b>Impacts of Restriction</b>	Increase in monitoring, education, and research costs
<b>Negatives</b>	Common ship-fouling alga <sup>9</sup> ; blooms and mats are unsightly and interfere with recreation <sup>1</sup>
<b>Expectations</b>	More nuisance conditions in enriched, eutrophic disturbed systems
<b>Cost of Impacts</b>	Decreased recreational and aesthetic value; decline in ecological integrity; increased research expenses
<b>“Eradication” Cost</b>	Undocumented

### IV. Control and Prevention

#### a. Detection

<b>Crypsis:</b>	Extremely high; high morphological plasticity <sup>5</sup>
<b>Benefits of Early Response:</b>	Undocumented

<b>b. Control</b>	
<b>Management Goal 1</b>	Nuisance relief
Tool:	Copper
Caveat:	Copper tolerance reported in <i>E. compressa</i> <sup>19</sup>
Cost:	Undocumented
Efficacy, Time Frame:	Undocumented
Tool:	Terbutryn
Caveat:	Kills most submerged vegetation
Cost:	Undocumented
Efficacy, Time Frame:	Regrowth often does not occur for 24 weeks
