Office of the Great Lakes**

**Michigan Department of Environmental Quality
Office of the Great Lakes**

Cover Photos (clockwise from left):

A fish elevator was constructed at the Menominee Dam in 2015; contaminated sediment was dredged from the Menekaunee Harbor in 2014; restoration in Menekaunee Harbor in 2015 included installing a variety of habitat structures for fish and wildlife, such as this brush pile. Photos courtesy of Wisconsin Department of Natural Resources (WDNR).

Acknowledgments

We, the WDNR and the MDEQ, would like to acknowledge the many contributions of members of the Lower Menominee River AOC Citizen’s Advisory Committee (CAC) and Technical Advisory Committee (TAC) in the development of this 2015 RAP Status Report, the Fish and Wildlife Population and Habitat Management Plan, previous RAPs and RAP Updates, and public outreach materials and activities. CAC and TAC collaboration with state and federal agencies has resulted in materials and activities that reflect local issues and concerns.

DRAFT

Purpose

This 2015 Remedial Action Plan (RAP) Status Report documents progress made on restoration of the Lower Menominee River Area of Concern (AOC) in 2015. This document is a brief summary of recent progress and the status of the AOC at the end of 2015. The WDNR and MDEQ, who share oversight of this AOC, intend to submit a longer, more detailed RAP Update in early 2017 documenting AOC progress in both 2015 and 2016, in order to effectively communicate progress to the public as well as to local, state, and federal agencies.

Background

Under the 1987 Amendment to the Great Lakes Water Quality Agreement (Agreement) (GLWQA, 1987), a treaty between the United States and Canada, AOCs were described as a “geographic area that fails to meet the General or Specific objectives of the Agreement where such failure has caused or is likely to cause impairment of beneficial use or the area’s ability to support aquatic life.” “Critical pollutants” were described as “substances that persist at levels that singly, or in synergistic or additive combination, are causing, or are likely to cause, impairments to beneficial uses (BUIs) despite past application of regulatory controls due to their: presence in open lake waters; ability to cause or contribute to a failure to meet Agreement objectives through their recognized threat to human health and aquatic life; or their ability to bioaccumulate.” The Agreement directs that agencies approach these issues using a comprehensive and ecosystem approach to restore and protect beneficial uses and directs development of RAPs to address these issues. The agencies view this to mean to approach restoration and protections within the watershed adjacent to the AOC. Sources of contaminants beyond the AOC are not considered or addressed.

The Menominee River AOC boundary includes the lower three miles of the Menominee River from the Park Mill Dam (Upper Scott Dam) to the river mouth and extends approximately three miles north of the river mouth along the adjacent Green Bay shoreline to John Henes Park and three miles south of the river mouth along the adjacent Green Bay shoreline, including Seagull Bar. The AOC boundary includes portions of Marinette County in Wisconsin and Menominee County in Michigan and is within the City of Marinette, Wisconsin, and the City of Menominee, Michigan. The AOC includes six permanent islands: Blueberry, Little Blueberry, Boom, Stephenson, and Strawberry, which are found within the lower three miles of the Menominee River; and Green Island, which is located in Green Bay approximately five miles east of Seagull Bar. This description is based on the 1990 Lower Menominee River Remedial Action Plan (WDNR and MDNR, 1990) and the 1996 Lower Menominee River Remedial Action Plan Update (WDNR, 1996).

Six of the potential 14 BUIs described under the 1987 Agreement (GLWQA, 1987) were identified for the Lower Menominee River when it was designated as an AOC. These BUIs included the following: “restrictions on fish and wildlife consumption,” “restrictions on dredging activities,” “degradation of benthos,” “degradation of fish and wildlife populations,” “loss of fish and wildlife habitat,” and “beach closings” (a.k.a. “restrictions on recreational contact”). Significant upgrades to the City of Marinette’s and the City of Menominee’s wastewater treatment plants resulted in removal of the “restrictions on recreational contact” BUI in 2011, leaving five impairments to be addressed.

Restoration Sites in the Lower Menominee River Area of Concern

Sediment Remediation Projects

Most of the identified beneficial use impairments in this AOC were influenced by the presence of contaminated sediments. All sediment remediation projects in the AOC are now complete. See below for more details on the status of the projects.

The Green Bay Paint Sludge Site, which was purchased by Lloyd-Flanders Industries, Inc., in 1982, is located north of the mouth of the Menominee River, along the Green Bay shoreline in the City of Menominee. The site shoreline, water, and sediments behind the plant were contaminated with paint wastes from a previous owner. In 1992, Lloyd-Flanders was ordered by the State of Michigan to investigate and remediate the paint sludge contamination. The company completed site remediation work in 1995 and 1998. The Administrative Order also requires ongoing site maintenance, including collection of paint nodules (aka paint balls) along the Green Bay shoreline north and south of the Lloyd-Flanders plant monthly and after storm events during open water. The paint nodules are stored on-site and then disposed of at a hazardous waste facility.

The Wisconsin Public Service Corporation (WPS) Marinette Manufactured Gas Plant Site is located along the southern bank of the Menominee River in the City of Marinette near Boom Landing. While the plant was operating from 1910 to 1960, residual coal tars from the plant washed into the river via a former slough, contaminating the river sediments. Negotiations between the United States Environmental Protection Agency (USEPA) Superfund, WDNR, and WPS resulted in a decision in 2012 to remove the coal tar contaminated sediments. Site

remediation was completed in 2013. Ongoing maintenance and monitoring includes the reactive carbon core mat and sand cover and requires a five-year review in 2018.

The Ansul/Tyco Arsenic Site is located downstream of the WPS site along the southern bank of the Menominee River in the City of Marinette near the Tyco International plant. The legacy arsenic contamination resulted from arsenic salts produced by the Ansul Fire Protection Company as a byproduct of herbicide manufacturing between 1957 and 1977. The USEPA Superfund-negotiated phase one remediation, requiring arsenic levels in sediments to be at 50 parts per million (ppm) or less, was completed in 2014, and the Great Lakes Legacy Act (GLLA) enhanced arsenic remediation, requiring arsenic levels in sediments to be at 20 ppm or less, was completed in 2015. Ongoing maintenance and monitoring includes the barrier wall and sand cover and requires a five-year review in 2018.

Menekaunee Harbor is located near the mouth of the Menominee River, on the south side. It is owned primarily by the City of Marinette. Sediment quality in the harbor was degraded by elevated levels of metals and polycyclic aromatic hydrocarbons (PAHs) from various upstream sources. The City and the WDNR worked together to restore the harbor in 2014 and 2015.

Sediment investigations in the Lower Scott Flowage (between the two dams) in 2013 and the Rio Vista Slough in 2014 have confirmed that no additional remediation will be needed in those locations. Thus, all remediation actions for known contaminated sediment sources in the AOC have now been completed. See Attachment D for a summary of the current status of the legacy contamination sites in the AOC.

Degradation of Benthos and Restrictions on Dredging BUIs

The Lower Menominee River AOC BUI Restoration Targets for the benthos and dredging BUIs required remediation of the known contaminated sediments (remedial activities described above), with the additional component for the dredging BUI to include development of a Dredge Management Plan (DMP) (WDNR and MDEQ, 2008). The known contaminated sediments have been remediated, thus Wisconsin and Michigan can move forward with recommending removal of the “degradation of benthos” BUI, and then the “restrictions on dredging activities” BUI, once the DMP is completed. The states have determined, with USEPA’s concurrence, to pursue the option of combining the DMP with the restrictions on dredging activities BUI removal package, rather than completing two separate documents. Both of these BUIs could be removed in 2016.

Dredging of arsenic-contaminated sediment in the South Channel in 2014

Cheryl Bougie, WDNR

Restrictions on Fish Consumption BUI

The Michigan Department of Health and Human Services (MDHHS; formerly the Michigan Department of Community Health) and the MDEQ have conducted a statewide fish consumption advisory assessment that compared fish tissue contaminant levels in all Michigan AOCs, including the Menominee River, to non-AOC reference sites. The MDCH, MDHHS, and the WDNR will review the fish tissue assessment results in 2016 to determine impairment status. The “restrictions on fish consumption” BUI could be removed in 2016. The WDNR collected fish used for this assessment in the Menominee River and the Peshtigo River reference site, and the Michigan Department of Natural Resources (MDNR) collected fish for the reference sites.

Fish and Wildlife Habitat and Populations BUIs

To remove all of the designated beneficial use impairments and delist the AOC, activities beyond the remediation of contaminated sediment sites will be required. The *2013 Fish and Wildlife Population and Habitat Management and Restoration Plan Update* (Plan; WDNR and MDEQ, 2013) is the principal document guiding the removal of the “degradation of fish and wildlife populations” and “loss of fish and wildlife habitat” impairments. As of December 31st, 2015, one of the five overarching restoration goals and five of the objectives contained in the Plan have been achieved, and many activities contributing toward the achievement of the remaining objectives have either been completed or are in progress. See Attachment A for the Goals and Objectives Table (Table 1 from the Plan), along with estimated completion dates.

The activities listed in the Activities Table (Table 2 from the Plan) have been included in the BUI Tracking Matrix in Attachment B, along with all of the other actions needed to remove BUIs and delist this AOC. Many of the activities have been completed, and many more are currently in progress. Following are some examples:

- Three years of fish population surveys were completed in the AOC and reference sites in 2015; preliminary results show that “There is evidence of recruitment in segment 1...” (Lower Scott Flowage) objective has been achieved, and final results will be evaluated in early 2016 to determine whether the lower river (segments 2-8) objective has also been achieved
- Safe downstream fish passage around Park Mill Dam was completed in 2015
- Upstream sturgeon passage (fish elevator) around Menominee and Park Mill Dams was completed in 2015
- Safe downstream fish passage around Menominee Dam planning and design work is in progress, to be implemented by September 2016
- Vegetation improvements (invasive species control) for rookery habitat on Strawberry, Boom, Blueberry, and Little Blueberry Islands are in progress, to be substantially completed in 2016

Photos of Little Blueberry Island before and after cutting and treating of invasive plants in 2015

Ecology and Environment, Inc.

Ecology and Environment, Inc.

- The City of Marinette Planning Commission responded to the CAC's letter in 2015 requesting protections for habitat restoration project areas by approving all of the CAC's requested zoning and planning changes; the CAC and TAC agree that the "Long-term protection..." goal has been achieved
- Removal of debris and excess riprap in South Channel below Ogden Street Bridge is in progress, to be completed in 2016
- South Channel habitat restoration project final design was completed in 2015, with implementation planned for 2016
- Menekaunee Harbor habitat restoration project implementation is in progress, to be completed in 2016, with invasive plant monitoring and treatment to follow
- Larval lake whitefish monitoring occurred in 2015, with the final report to be completed in 2016

Next Steps

The "Lower Menominee River AOC BUI Tracking Matrix 2015" (Attachment B) includes more details on AOC project status, management, cost estimates, and other necessary information. The WDNR, MDEQ, CAC, and TAC agree that only activities listed in this table are required to achieve the restoration targets for this AOC.

Following is a list of significant milestones likely to be reached in 2016:

- Removal of "degradation of benthos" BUI
- Completion of Dredge Management Plan and removal of "restrictions on dredging activities" BUI
- Potential removal of "restrictions on fish consumption" BUI (depending on results of fish consumption advisory assessment)
- Completion of Menekaunee Harbor habitat restoration project implementation, followed by vegetation monitoring and maintenance
- Completion of safe downstream fish passage at Menominee Dam
- Removal of debris and excess riprap in South Channel below Ogden Street Bridge
- Implementation of South Channel habitat restoration project, followed by vegetation monitoring and maintenance
- Completion of final report for fish population monitoring in the AOC and reference sites; this report will determine whether target fish species in lower river are meeting population objectives
- Larval lake whitefish monitoring project report completed; this study meets the criteria and no additional action is necessary
- Substantial completion of island rookery habitat restoration, followed by native vegetation planting, adaptive management, and monitoring and maintenance

The Lower Menominee River AOC is on track to complete all management actions in 2016. The states intend to begin proposing BUIs for removal in 2016, and the AOC could potentially be delisted in 2018. Continued progress has only been possible with the help of many partners who have put a lot of effort into restoring the Lower Menominee River. Great Lakes Restoration Initiative (GLRI) funding has been a critical component of this restoration effort.

Attachment A: Goals and Objectives Table (Table 1) from the 2013 Fish and Wildlife Population and Habitat Management and Restoration Plan, with additional notes showing completed objectives and estimated completion dates. The achievement of goals is dependent on achieving corresponding objectives.

GOALS				
Long-term protection is in place for natural areas and wetlands within the AOC, including Seagull Bar and riverine islands.	Nesting populations of a diverse array of wetland-dependent and riparian-associated birds are consistently present within the AOC.	The lake sturgeon population is enhanced.	Diverse and functional native fish and mussel assemblages are present in the AOC that sustain natural recruitment.	A healthy and diverse native vegetation community has been restored.
OBJECTIVES				
 Long-term protections deemed acceptable by the WDNR, MDEQ, TAC, and CAC have been established for all natural areas where habitat improvement work has taken place and contributes to achieving one or more BUI removal objectives.	In Progress (2016) Maintain or enhance habitat conducive to colonial waterbird rookery activity on known or prospective rookeries.	 Provide additional spawning and juvenile rearing habitat for lake sturgeon by providing passage upstream of both Menominee and Park Mill Dams (U.S. Fish and Wildlife Service, 2012).	In Progress (2016) There is evidence of recruitment within segments 2-8 for the following fish species: lake sturgeon walleye, yellow perch, muskellunge, smallmouth bass, largemouth bass, and northern pike.	In Progress (2018) Invasive, non-native species comprise no more than 33% of the vegetation community in protected natural areas of the AOC.
	 Monitor the rookery activity of known or prospective rookeries.	In Progress (2016) Provide a means for fish to pass safely downstream of both Menominee and Park Mill Dams (USFWS, 2012).	There is evidence of recruitment in segment 1 for the following fish species: walleye, rock bass, bluegill smallmouth bass, largemouth bass, and northern pike. 	
			There is evidence of recruitment within the AOC for native mussel species. 	
			In Progress (2016) Monitor for larval lake whitefish to determine necessity of future habitat improvements.
